

Session_10

Q.1 Declare a string variable called songTitle and assign it the value 'Tum Hi Ho'. Print the length of the string using strlen().

A.1 #include <stdio.h>

#include <string.h>

```
int main() {  
    char songTitle[] = "Tum Hi Ho";  
  
    printf("Length of song title: %lu\n", strlen(songTitle));  
  
    return 0;  
}
```

Q.2 Take input for two usernames (as strings) and compare them using strcmp(). Display whether they are the same or different.

A.2 #include <stdio.h>

#include <string.h>

```
int main() {  
    char username1[50];  
    char username2[50];  
  
    printf("Enter first username: ");  
    scanf("%s", username1);  
  
    printf("Enter second username: ");  
    scanf("%s", username2);  
  
    if (strcmp(username1, username2) == 0) {
```

Session_10

```
    printf("Both usernames are the same.\n");
}
else {
    printf("The usernames are different.\n");
}
return 0;
}
```

Q.3 Copy the string 'Flipkart' into another string variable called shoppingApp using strcpy(), then print the value of shoppingApp. Hint: Make sure to declare enough space for the destination string.

A.3 #include <stdio.h>

```
#include <string.h>
```

```
int main() {
    char shoppingApp[20];
    strcpy(shoppingApp, "Flipkart");
    printf("Shopping App: %s\n", shoppingApp);
    return 0;
}
```

Q.4 Build a small script that takes the user's full name as input and creates a username by copying only the first 5 characters using strcpy(). Print the generated username. Constraint: If the name is shorter than 5 characters, use the full name as the username.

A.4 #include <stdio.h>

```
#include <string.h>
```

```
int main() {
```

Session_10

```
char name[100];
char username[6];
int length;
int i;
printf("Enter your full name: ");
scanf("%[^\n]", name);
length = strlen(name)
if (length < 5) {
    strcpy(username, name);
}
else {
    for (i = 0; i < 5; i++) {
        username[i] = name[i];
    }
    username[5] = '\0';
}
printf("Generated username: %s\n", username);
return 0;
}
```
